

LinkedIn Profile: Andreas Schwarzkopf

1. Headline

Production-ready AI for the Mittelstand · 16 years in AI · Mercedes-Benz experience · senior engineering team

Alternative:

Secure AI for the Mittelstand · measurable workload reduction · internal knowledge systems · senior engineering team

2. Banner

Production-ready AI for the Mittelstand
Secure AI that measurably reduces workload and unlocks internal company knowledge.

3. About

I build secure, production-ready AI systems for Mittelstand companies.

The business value is usually found in places where teams spend too much time on repetitive work, where internal knowledge is hard to access, or where mistakes are expensive. Customer support, document workflows, internal research, offer preparation, knowledge management and sensitive operational processes are typical examples.

I do not start with a model. I start with the process.

Where is valuable time being lost?
Which knowledge is trapped in documents, tickets, emails, systems or experienced employees?
Which answers need to be reliable?
Which data must stay under control?
How will we measure whether the system actually helps?

Only when the business case is clear does it make sense to design and build the system.

For tax advisory firms: I am also building Flowbeaver Accountant, an AI product for German tax practices. The goal is simple: documents in, DATEV-ready batches out. A selected group of tax firms is currently involved in the initiative.

I have a degree in business administration with a focus on business informatics, more than 30 years of entrepreneurial experience and 16 years of hands-on AI project experience. My background includes project-based roles and assignments with Mercedes-Benz Tech Innovation, Mercedes-Benz Bank and Mercedes-Benz AG in a production environment.

What I build:

RAG systems on internal company knowledge
AI assistants for support and internal processes
Document processing and extraction workflows
LLM workflows with evaluation and monitoring
Architectures for EU hosting, self-hosting or controlled enterprise environments

I design the architecture and write code myself. I also deliver with a senior engineering team. That keeps strategy, architecture, implementation and operational reality close together.

This matters because many AI projects fail in the handover between business idea, technical concept and actual implementation. The demo works. The system does not. The team learns too late that the data is messy, the workflow is more complex than expected, or the business case was never strong enough.

I try to make these things visible early. If AI is not the right tool for a process, I say so.

My strongest experience is in environments where data is sensitive, processes matter and mistakes are not harmless: banking, production, internal knowledge systems and tax advisory workflows.

One example from my work is a support system for around 3 million customers with a 94 percent hit rate. Another is Flowbeaver Accountant, a product for tax firms with EU hosting and clear rules against hallucination.

If you want to find out where AI can measurably reduce workload or make internal knowledge usable in your company, send me a concrete process.

4. Featured Card: Main Offer

Title: Production-ready AI for the Mittelstand

Subtitle: Secure AI systems for processes where workload, knowledge and error costs matter.

Description: I build RAG systems, AI assistants and automated document workflows for Mittelstand companies. The focus is measurable business value: less manual work, better access to internal knowledge and reliable quality in day-to-day operations.

CTA: Review an AI use case

5. Featured Card: Flowbeaver Accountant

Title: For Tax Firms: Documents In. DATEV-Ready Batches Out.

Subtitle: Secure AI for tax workflows where documents, deadlines and client data matter.

Description: Flowbeaver Accountant helps tax advisory firms reduce manual work in document and receipt processes. Built with tax firms, for tax firms. EU hosting, clear rules against hallucination and a strong focus on real work in daily practice.

CTA: View Flowbeaver Accountant

6. Featured Card: Internal Knowledge Systems

Title: Turn Internal Knowledge Into Operational Leverage

Subtitle: RAG systems and AI assistants for support, specialist teams and internal research.

Description: Many companies already have the knowledge they need. It is just scattered across documents, tickets, emails, wikis, systems and experienced employees. I build AI systems that make this knowledge securely accessible and reduce repetitive search and research work.

CTA: Review a knowledge process

7. Experience Entry: Flowbeaver AI

Title: Founder & AI Engineer

Company: Flowbeaver AI

Description: At Flowbeaver AI, I build secure, production-ready AI systems for Mittelstand companies.

The focus is on use cases where AI has to create measurable business value: reducing workload, making internal knowledge accessible, improving quality or giving skilled teams more capacity.

Typical systems include:

- RAG systems on internal company knowledge
- AI assistants for support and internal processes
- Document processing and extraction workflows
- LLM workflows with evaluation and monitoring
- Architectures for EU hosting, self-hosting or controlled enterprise environments

I work close to the implementation. I design the architecture, write code and deliver with a senior engineering team. This keeps the business case, technical build and operational reality aligned.

Flowbeaver Accountant is one product that grew out of this work. It applies the same principles to a specific professional use case: German tax advisory firms.

The practical goal: documents in, DATEV-ready batches out.

A selected group of tax firms is currently involved in the initiative. The aim is to reduce manual work in daily tax practice while handling sensitive client data responsibly.

8. Experience Entry: Flowbeaver Accountant

Title: Founder

Company: Flowbeaver Accountant

Description: Flowbeaver Accountant is an AI product for German tax advisory firms.

The goal: documents in, DATEV-ready batches out.

The product supports tax firms with the processing, classification and preparation of receipts and documents. The focus is measurable relief in daily practice, careful handling of client data and reliable AI usage.

Key principles:

EU hosting

Data protection and confidentiality

Clear rules against hallucination

Workflows built for tax firms, not generic AI demos

Development close to real document and receipt processes

We are currently working on the practical implementation with selected tax firms.

9. Experience Entry: Mercedes-Benz Projects

Title: AI Engineer / AI Architect

Company: Mercedes-Benz Tech Innovation, Mercedes-Benz Bank, Mercedes-Benz AG

Description: AI project experience across several Mercedes-Benz environments, including technology, banking and production.

The common thread: AI in demanding corporate environments where data quality, process understanding and reliable implementation matter more than a polished demo.

Focus areas:

AI applications for internal and production-related processes

Work with sensitive data and established system landscapes

Technical implementation of AI and data solutions

Coordination between business teams, IT and delivery
Usable systems instead of prototypes without operational value

This experience now informs my work with Mittelstand companies: secure AI, clear processes, realistic architecture and measurable business value.

10. Experience Entry: Munich Knowledge Hub

Title: AI Architect / Lead Developer

Company: Munich Knowledge Hub

Description: Designed and built a permission-aware AI knowledge hub for 100+ employees.

The system makes internal knowledge easier to access while respecting permissions, data boundaries and production requirements. The goal was a usable knowledge layer for daily work, not a chatbot demo.

Core responsibilities:

- Architecture and implementation of a permission-aware RAG system
- Integration with Microsoft Entra ID for access control
- Vector search with PostgreSQL and pgvector
- MCP server implementation for tool and context access
- LLM integration with Claude Enterprise
- Evaluation logic for answer quality and reliability
- Technical delivery from concept to working system

The project combined enterprise requirements with hands-on AI engineering: security, permissions, data quality, retrieval logic and usable interfaces.

11. Services

Available for: Services

Primary services:

- AI Consulting
- AI Architecture
- Machine Learning

Additional services, if available on LinkedIn:

- Generative AI
- Software Development

Data Engineering
Process Automation

12. Top Skills

Pin these:

Generative AI
Large Language Models (LLM)
AI Architecture

Accounting

13. Profile Logic

The profile leads with business value, not biography.

Core positioning:

Production-ready AI for the Mittelstand
secure implementation
measurable workload reduction
internal knowledge made usable
delivered by someone who understands both business and code

Proof points:

16 years in AI
Mercedes-Benz project experience

senior engineering team
entrepreneurial background
hands-on delivery in banking, production, internal knowledge systems and tax advisory workflows

Flowbeaver Accountant remains visible as a concrete product proof. It shows that the same principles also work in a highly sensitive professional environment with confidential client data, documents and strict quality requirements.
